

# Operational Data Management and Cleansing

## Accelerate your data cleansing efforts

In this data-driven business era, it more important than ever to keep the data clean. To do so, enterprises have established data operations teams. They are responsible for data cleansing efforts and making the data ready for consumption by other business units. However, data cleansing requires a combination of people, process and technology to solve the most common data clearing use cases.

## Typical Use Cases

Amongst various use cases for data cleansing, below mentioned are the most critical ones that we have been able to address effectively for our clients.

### Single View of Customer

Cross-reference entity data from various internal sources and industry vendor feeds (like Bloomberg, S&P, etc.) to create a single view of the customer

### Building Hierarchy and Relationships

Build and enrich client hierarchy. Consume, cleanse and link other data domains like accounts, products, etc. Establish complex relationships across the data to provide a comprehensive view of the clients

### Workflows and Dashboards

Provide a transparent view of data cleansing efforts, with controls and dashboards for detailed reporting

## Business Benefits

There are multiple benefits in establishing a clean and robust data clearing house. Below are the top 3 benefits.

### Maximize Cost Savings

Minimize penalties resulting from incorrect regulatory reporting

### Lower Capital Reserves

Reduce exposure to potentially lowering the capital reserve requirements

### Accelerate Business Growth

Accelerate growth by leveraging and consuming clean data within the organization

## Choosing the Right Platform and Partner

The combination of the right technology, process and people can accelerate your data clearing activities and establish a state-of-the-art data clearing house. At Xoriant CDi, we live and breathe data cleansing since 2001. Providing value-add from day one, below are some differentiators that set us apart.
